I have been using 5G for over a year in my home. This is my experience.

My brother, and a number of friends, have been warning me all about the dangers of 5G. They tell me to “stay away” from it, and avoid any technology that might have it. They do so because they earnestly believe that it is dangerous. They know that it is dangerous ever since there was a flood of articles about how dangerous it is.

The articles are convincing. They have great charts, links to impressively worded scientific studies, and stores that tug at my emotions.
Linked to Cancer, Heart Disease, Diabetes, Alzheimer’s, and Death”. Yet, it’s been in use in China for nearly three years with ZERO problems.

The articles talk about cell damage due to radiation. They discuss about how once the cells are damaged, that you can get ill. You can catch diseases, and that you are receptive to such things as cancer, strange and exotic illnesses and even the COVID-19. Yikes!

Nasty stuff for sure.

Except...

Except...

China has been wired for domestic 5G for a couple of years now. It’s NOT coming soon to you and you need to avoid it and stay clear of it. It arrived years ago, been here, been everywhere, and the fear-mongering is three years too late...

...inside of China.

Sorry, but that’s just the way it is.

Like how there was an article in 2019 about how the Chinese were afraid of the implementation of "face recognition" technology. Except that "face recognition" technology was implemented around 2014 and today is considered a mature, and well established technology.
I guess the point here is that the United States is not leading the world in "cutting edge" technology. It is lagging behind.

So the products and the "innovations" that Americans need to be fearful of are all chimeras. Americans are roughly (right now) approximately 3 to 5 years "behind the ball".

Yes. China is where all of the world’s factories are and where most of the technology development occurs. My 5G Huawei phone is almost two years old, and my Wifi station is a full year and a half old.

And that is the way that it is.

The anti-5G narrative.

Like most of the fear-mongering American media, it only applies to Americans.

When other people, outside of the United States, read the American “news” they end up scratching their head. “WTF?” they ask.

It’s not just China, Europe, Russia and all of Africa. It’s places that Americans consider to be “Third World Shit Holes” like Cambodia and Vietnam...
In Hanoi, Vietnam everyone is using the amazing Huawei 5G phones with amazingly quick speeds and all sorts of abilities and capabilities unheard of in the United States. You know like 3D QR purchases, and holographic GPS overlays.

In the United States, 5G is a new, and unobtainable, technology for Americans. It’s a big dark “boogieman” that Americans must fear.

But for China, nah. The first 5G towers domestically are over three years old.

We’ve been using 5G and getting (according to the US media) “dangerously irradiated” for almost three years now...
My theory on why...

So 5G technology came out and started to be disseminated everywhere. It went to China first. Then to Vietnam, Germany, Poland, France, Brazil, and then started to snake into the American markets after the American agencies finished their near-glacial approval process...

The American industry could not compete.

Diversity director being interviewed on how “inclusiveness” and “social re-alignment” will make their technology company stronger.

The 5G technology is so over-the-top better than 4G and it’s predecessors that it is “mind blowing”. It’s like comparing modern CGI animation with 1920’s black and white cartoons. Fast is only part of the story. The first
time I turned on my phone, I was actually startled in how fast it turned on and how blazingly quick it worked.

The American industry could not compete.

Over the last decade they laid off American engineers, outsourced to India, and China, and contracted work to China. Meanwhile they spent enormous amount of time, resources and expenditures on “Diversity Directors” and social engineering causes.

Now, do not misunderstand.

It’s not that I do not think that “fairness”, and “corporate responsibility” and the “environment” are not important. They are. Very much so. I believe that we all need to step up to the plate and work together to make the world a far better place to live in.

However…

The point that I am making is that the emphasis on what a company does, it’s “bottom line” and the salaries and the work force do not reflect a
healthy working and corporate environment in America. Instead other consider-
erations have taken over. While I use the social re-engineering as an ex-
ample, it actually consists of an entire litany of ills. From shareholder des-
ires to human resource policies.

Consider…

- The salaries of one “Diversity Director” at any of the companies above is around $450,000 / year.
- The salary for a design engineer is around $50,000 / year.

My argument is that instead of hiring five design engineers to develop 5G technology, the America companies opted, instead to hire social re-engi-
neers. This resulted in a slew of meetings, training, and policies for so-
cial justice. While other nations, and other companies, focused on improv-
ing their products, their services and their manufacturing.

Instead.
American technology is losing ground and is being eclipsed by hard-working intelligent competitors that reward merit and hard work with wads of cash. Meanwhile American industry clutches on fads, and social restructuring in the belief that their monopolies will always stay intact.

Now, with that understood...

The anti-5G cabal

The anti-5G narrative only came into being when Huawei completely eclipsed their American counterparts in technology leadership, and their CEO’s came to Trump and begged for his help.

It did not materialize in a manner associated with scientific concern or distress. It came about precisely when the political scene narrated an anti-Huawei, and thus anti-5G stance.
The American industry, lead by Cisco approached the Trump administration, latched on his “Make America Great Again”, anti-China screed, and demanded for action. Their arguments were valid. They donated millions to the Republican and Trump campaigns, and now they needed government help and action.

They genuflected in front of Trump. Kissed his signet ring and placed accolades at the feet of John Bolton and Mike Pompeo. And then…

…lo and behold, it suddenly became a “national security issue”.

The flood of articles came immediately hard and fast, once President trump declared war on Huawei.

One wonders why America ends up with Trump as president. Trump is just a symptom. He is not the only one doing the non-stop and endless lying.
America is an empire of lies and its leader is the emperor of lies. One shouldn’t be surprised.

All this talk about US-China conflict is just wishful thinking. All China needs to do is ignore the lying liars and go its own way. America will self immolate. A people so delusional with its own lies will wake up one day to notice that reality and viruses do not care. Nature abhors a moron; it most certainly abhors a moronic and delusional nation.

There is no news in truth and no truth in news.

-Peter Man

When I point this fact out, they retort, well the President is (after all) looking out for people. He wants to protect them. You know, from the evil dark communists that want to take over the world. We know this, because Trump told us so.

Well. Personally, I think it’s more an economic issue rather than a health issue.

You know, like how GM bought up all the trolley cars in Los Angles, or the way that GM rode Preston Tucker out of business. It’s an American norm. If your company has a monopoly you use everything in your power to crush the opposition.
GM bought up all the streetcars in Los Angeles and then sold their buses to a captive market.

So...

An American company is being eclipsed by a Chinese company that spent money on scientists and engineers. While the American company spent money on social engineering programs, diversity, and diversity officers (all very, very well paid for, of course).

This is the result.

- **Huawei**: US will lag in 5G if it is blocked after Trump...
- **Trump rejects nationalizing 5G, weakens US hand**
- **Boris Johnson defies Trump and gives Huawei the green**...
- **Huawei says Trump’s ban will hurt US 5G deployment** — CNET
The result of all this.

Well, all these events have created a very interesting situation.

- People in Vietnam have access to 5G, and Americans do not.
- People in Burma, Cambodia, and Japan have access to 5G. Americans do not.
- People in China, Russia and Poland have access to state-of-the-art 5G technology. Americans do not.

Don’t you think that there is something wrong about this picture?

But, you know, Americans are just fine and dandy with that. You see, 5G is bad. It is terrible. It’s evil communist technology. Not the pure, free and wonderful “democratic technology” constructed through “American exceptionalism”, don’t you know. Just google it. It’s outrageous.

So Americans can live without that terrible, icky, nasty technology.
How do I know?

I've been using 5G phones and a base station in my house for years now.

I have a 5G router in my living room, and another on the nightstand beside my bed. (You see, the 5G technology cannot penetrate walls that well. You need to have multiple wifi stations to use it effectively.)

My two year old, 5G router inside my living room. The normal 2.4G is the low flat rectangular box to the right, and the 5G is the big white cube to the left. Sorry for the dust.

Now I am not sick, I haven’t been sick and none of the problems that all those articles profess that should happen to me are no where to be found.
Now the reader should not be confused.

Just because the radiation has not affected me, my family, those around me, the city that I live in, or my nearby business associates, does not mean that the American narrative is a fiction. It could be that we are all the exception rather than the rule.

Perhaps.

I’ve been using 5G for a while now, and I don’t see anything wrong.
I well remember the 1970’s. My father was trying to keep his weight down, and so he switched from drinking Coke-cola to “Tab”.

He would go to the local “beer distributor” and pick up cases of the stuff. And he ended up guzzling that soda just like it was water.

In a world filled with sugary drinks, the Tab product was one of the first to offer a non-sugar beverage.

Tab was similar to Coke except that it didn’t use sugar.
Tab is a diet cola soft drink created and produced by The Coca-Cola Company, introduced in 1963. Coca-Cola's first diet drink, Tab was notably popular throughout the 1960s and 1970s, and several variations were made, including a number of fruit-flavored, root beer, and ginger ale versions. Caffeine-free and clear variations were released in the late-1980s and early-1990s.

-Wikipedia

And it really started to take a big bite into the Pepsi-cola franchise. They started to lose money, and their competitor (the one who manufactured Tab) started to gobble up Pepsi market-share.

So what do you think happened?

Suddenly sugar-free substitutes were “dangerous” and had to be banned. Otherwise people would get brain damage and cancer!

That’s right!
All of a sudden, studies “proved” that the sugar substitute in Tab was dangerous. As I recall, lab mice started to die.

Of course, it came out later that they were given near-lethal does of sugar-substitute to begin with. I think it was an equivalent to a human ingesting a 50lb sack of chemicals every day until they died. It was pretty gosh-darn horrific, I’ll tell you what.
The studies proved that mice feed enormous doses of sugar substitute got fat, ended up with cancer and died.

Anyways, this is all “ancient” history. Those that have a monopoly do everything in their power to keep and hold market-share. This was true of GM, Coke-cola, and is very true with Microsoft and Cisco.

So I am not at all surprised that they decided to create an exclusive market for their products.

You WILL use American made cell-phones! You will use what ever technology we say, and we will make it a law to punish you if you refuse!

Just like how the American military-industrial market has forced the DoD to purchase inadequate, outdated, and very expensive products with questionable utility and dangerous application.

The problem is, it’s only a short-lived phenomenon.

Soon, they will lose ground in the market unless they develop innovation, product design and development. But that is not what I am seeing. Instead, I am seeing more of the “same oh, same oh”. With no real aggressive techni-
Conclusion

I use 5G technology. I haven’t had any problems with it. I like its speed and the amazing things that it can do. It is revolutionizing technology outside of America and while the rest of the world are advancing in leaps and bounds, the United States is hunkering down and entrenching.

If this keeps up, the prognosis will not be good for America and Americans.

I hope that you enjoyed this post. I have more in my Trump Trade War Index. You can access it through this little green button.
